Genetics in humans cannot be studied by performing controlled crosses rather, analysis of inheritance patterns in an existing population must be used. An approach, called pedigree analysis, is used to study the inheritance of genes in humans.

A pedigree is a representation of our family tree. It shows how individuals within a family are related to each other. We can also indicate which individuals have a particular trait or genetic condition. If we take a pedigree, which we usually try to include at least three generations, we might be able to determine how a particular trait is inherited.

This worksheet gives students a chance to practice identifying genotypes on pedigree charts. The pedigrees focus on human genetic diseases, such as albinism, cystic fibrosis, tay-sachs, and sickle cell anemia. Some students do struggle with these charts, so I usually practice doing a few with them. If the parents are both heterozygous ( $Aa \times Aa$ ) many students will be confused about the genotype of an offspring who does not have the disease.

A pedigree is a diagram that depicts the biological relationships between an organism and its ancestors. It comes from the French “ pied de grue ” ( “ crane ’ s foot ” ) because the branches and lines of a pedigree resemble a thin crane ’ s leg with its branching toes. A pedigree is used for different animals, such as humans, dogs, and horses.

genetics. Pedigrees are usually learned soon after students have a grasp of Punnett squares and the concept of segregation. Some students will have an easy time with pedigrees, depending on how well they understood genetic crosses. In this activity, students are introduced to the concept of a pedigree of a family and they practice determining the genotypes of family members based on observed recessive phenotypes.

Known phenotypes in a family are used to infer genotypes. Both autosomal genes and sex-linked genes can be traced with pedigrees.

- Tracing autosomal genes: Equal numbers of males and females will have the recessive phenotype. Anyone with the recessive phenotype must be homozygous recessive.

Pedigrees are interesting because they can be used to do some detective work and are often used to study the genetics of inherited diseases. For example, pedigrees can be analyzed to determine the mode of transmission for a genetic disease:  
(1) Dominance- whether the disease alleles are dominant or recessive;
