Genetic Algorithms And Genetic Programming

The Genetic Algorithm (GA) is a probabilistic search algorithm that iteratively transforms a set (population) of objects (usually a fixed-length binary string), each with an associated fitness value, into a new population of

offspring objects using the Darwinian principle of natural selection and operations that mimic naturally occurring genetic operations, such as sexual recombination (crossover) and mutation.

Genetic Algorithms and Genetic Programming

Genetic algorithms and genetics programming are known to achieve robust, high-quality solutions to difficult problems. Due to increasing computing power, these methods have been successfully applied to problems in logistics, data mining, and various other fields with complex data.

Genetic Algorithms and Programming seek to replicate nature's evolution, where animals evolve to solve problems. Genetic programming refers to creating entire software programs (usually in the form of Lisp source code); genetic algorithms refer to creating shorter pieces of code (represented as strings called chromosomes).

Genetic programming often uses tree-

based internal data structures to represent the computer programs for adaptation instead of the list structures typical of genetic algorithms. Grouping genetic algorithm (GGA) is an evolution of the GA where the focus is shifted from individual items, like in classical GAs, to groups or subset of items. [55]

In artificial intelligence, genetic programming is a technique of evolving programs, starting from a population of unfit programs, fit for a particular task by applying operations analogous to natural genetic processes to the population of programs. It is essentially a heuristic search technique often described as 'hill climbing', i.e. searching for an optimal or at least suitable program among the space of all programs. The operations are: selection of the fittest programs for reproduction and

Genetic Programming (GP) is a type of Evolutionary Algorithm (EA), a subset of machine learning. EAs are used to discover solutions to problems humans do not know how to solve, directly. Free of human

Genetic Algorithm (GA) is a search-based optimization technique based on the principles of Genetics and Natural Selection. It is frequently used to find optimal or near-optimal solutions to difficult problems which otherwise would take a lifetime to solve. It is frequently used to solve optimization problems, in research, and in machine learning.

The technique of genetic programming (GP) is one of the techniques of the field of genetic and evolutionary computation (GEC) which, in turn, includes techniques such as genetic algorithms (GA), evolution strategies (ES), evolutionary programming (EP), grammatical evolution (GE), and machine code (linear genome) genetic programming.

Genetic Programming: Genetic programming (GPs) is a evolutionary algorithm based methodology inspired by biological evolution to find computer programs that perform a user defined tasks. It is specialization of genetic algorithms where the individuals are the computer programs. GPs automatically solves problems without requiring the user to know or specify the form of structure of the solution.
