~~Instantaneous Center of Velocity (ICV): Any point on a rigid body or on its extension that has zero velocity is called the Instantaneous Center of Velocity of the body. Assuming one knows the ICV of a body, one can calculate the velocity of any point A on the body using the equation and recognizing that be definition . This gibes~~

~~The instant center of rotation, also called instantaneous velocity center, or also instantaneous center or instant center, is the point fixed to a body undergoing planar movement that has zero velocity at a particular instant of time. At this instant, the velocity vectors of the other points in the body generate a circular field around this point which is identical to what is generated by a pure rotation. Planar movement of a body is often described using a plane figure moving in a two-dimension~~

instantaneous centre or virtual centre of rotation. Consider two points A and B on a rigid link. Let v_A and v_B be the velocities of points A and B, whose directions are given by angles α and β as shown in Fig. 6.4. If v_A is known in magnitude and direction and v_B in direction only, then the magnitude of v_B may be determined by the instantaneous centre method as discussed below : Draw AI and BI perpendiculars to the directions v_A and v_B respec-

Instantaneous center of zero velocity. Instantaneous center of zero velocity is basically defined as the point about which a body appears to be rotating at any given instantaneous or instant. It will have zero velocity and there will be only one instantaneous center per body per instant of time. Instantaneous center of zero velocity acts like absolute center of rotation at the instant considered. we must note it here that it will not be a fixed point in a body nor a fixed point in a plane.

The concept of Instantaneous Centres of Velocity was covered in the section on Mechanisms. In this section the Analysis of Velocity and Acceleration are considered with particular reference to Cranks and Pistons. Klien's Construction for Piston Acceleration is introduced and a description of the Coriolis Component is given.

The instant center is also called the instantaneous center of zero velocity (IC). It lies on an imaginary axis of zero velocity, about which the body appears to rotate at a given instant. This axis is always perpendicular to the plane of motion. There are three basic cases to consider when solving problems using the instant center approach.
